## **DETAILED ACTION**

1. In view of the appeal brief filed on January 9, 2004, PROSECUTION IS HEREBY REOPENED. A new ground of rejection is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

- (1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,
  - (2) request reinstatement of the appeal.

If reinstatement of the appeal is requested, such request must be accompanied by a supplemental appeal brief, but no new amendments, affidavits (37 CFR 1.130, 1.131 or 1.132) or other evidence are permitted. See 37 CFR 1.193(b)(2).

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1, 2, 8, 10, 22, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alan Notman (USPat. 4,311,671). Alan Notman teaches a catalytic gas reactor (Figure 1; column 6, line 59 column 7, line 31) including:
- i. An enclosure (10) which defines an interior void (Figure 1) and a longitudinal axis down the center of item 42

Art Unit: 1763

- ii. A first partition (16A; column 6, lines 59-68) having a first orifice ("central hole"; column 2, lines 1-15; column 7, lines 3-7) defined therein, the first partition being positioned within the interior void such that:
  - a. The first partition divides the interior void into a first chamber (12A) and a second chamber (12B) and
  - b. The first orifice is in fluid communication with the first chamber and the second chamber (Figure 1; column 7, lines 3-7)
- iii. A gas connector (conduit 34) which has:
  - a. A passageway (34) defined there through and
  - b. A gas port (30) in fluid communication with the passageway and supplied by a gas source (see arrow entering 30; column 7, lines 1-10), the passageway having an inlet (34) and an outlet (32) and being in direct fluid communication with the first chamber (12A) of the enclosure
  - c. The gas source is advanced into the passageway (34) of the gas connector (conduit 34) via conduit 26
  - d. The gas port (30) being downstream of the gas connector inlet (34) and downstream of the gas connector outlet (32)
- iv. A gas dispenser (28A/B) in direct fluid communication with the second chamber (12B) of the enclosure; and
- v. An exit port (50) in fluid communication with the interior
- vi. A second partition (16B) having a second orifice (holes in 16B, not labeled, see crossing arrows indicating flow) therein wherein

Art Unit: 1763

a. The second partition is positioned within the second chamber (12B)

b. The first orifice has a first central axis (collinear to central axis of 42) and being aligned (colinear) with the longitudinal axis of the enclosure, the first central axis is further unobstructed such that gas can pass (see flow arrows) from the first chamber to the second chamber through the first central axis

c. The second orifice (holes in 16B other than 42, not labeled, see crossing arrows indicating flow) has a second central axis and the second central axis of the second orifice is offset (see Figure 1) relative to the first central axis of the first orifice

Alan Notman further teaches water vapor gas source ("boiler"; column 6, lines 32-35; column 4, lines 55-60; Table 1 - column 10, lines 40-60). Further, it is well established that in apparatus claims it is inherent that Alan Notman's gas processing apparatus can process water vapor gas. It is well established that apparatus claims must be structurally distinguished from the prior art (In re Danley, 120 USPQ 528, 531 (CCPA 1959). "Apparatus claims cover what a device is, not what a device does ."(emphasis in original) Hewlett - Packard Co . v. Bausch & Lomb Inc ., 15 USPQ2d 1525, 1528 (Fed. Cir. 1990), MPEP – 2114)

Alan Notman does not teach that his gas port (30) is upstream of the gas connector outlet (32). It would have been obvious to one of ordinary skill in the art at the time the invention was made to optimize the length of Alan Notman's gas connector (conduit 34) such that his gas port (30) is upstream of the gas connector outlet (32).

Art Unit: 1763

Motivation to optimize the length of Alan Notman's gas connector (conduit 34) such that his gas port (30) is upstream of the gas connector outlet (32) is to optimize gas mixing in Alan Notman's first chamber (12A) as taught by Alan Notman (column 1, lines 25-38; column 2, lines 9-15).

4. Claims 3-6, 21, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alan Notman (USPat. 4,311,671). Alan Notman is discussed above. Alan Notman further teaches points on Alan Notman's partitions (16A,B,C) that are collinear with the chamber's longitudinal axis (Figure 1). Alan Notman further teaches adjacent partitions (16A/B; 16B/C) such that each partition forms corresponding sub-chambers by interposing the corresponding partitions (Figure 1). Alan Notman further teaches partition orifice that are in direct fluid communication (see arrows in Figure 1) with the first chamber and the corresponding sub-chamber. Alan Notman further teaches an end wall (22c, Figure 1).

Alan Notman further teaches plural orifice (holes in 16A,B,C; not labeled, see crossing arrows indicating flow) with corresponding central axis where each orifice's central axis is offset relative to the central axis of each other orifice. Alan Notman further teaches a longitudinal axis, as above, that divides the enclosure into a first and second half (Figure 1) where orifice of each partition are either located in the first or second half of the partition.

Alan Notman does not teach partitions, in Figure 1, beyond 3. As a result, Alan Notman does not teach fourth, fifth, and sixth partitions resulting in corresponding fourth, fifth, and sixth subchambers.

Alan Notman does not teach that his first and second orifice comprise the largest orifice in his first and second partitions respectively such that the central axis of the first and second orifice are offset relative to each other.

Art Unit: 1763

Alan Notman does not teach his gas port disposed between the inlet and outlet of his passageway.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to duplicate Alan Notman's partitions thereby adding additional partitions to Alan Notman's catalytic gas reactor resulting in corresponding fourth, fifth, and sixth sub-chambers, and to optimize the dimension of Notman's orifice in each of the first and second patitions such that the largest orifice of each partition produce axis that are offset relative to each other, and to optimize the dimension (hight) of Notman's gas connector passageway such that his gas port disposed between the inlet and outlet of his passageway.

Motivation to duplicate Alan Notman's partitions thereby adding additional partitions to Alan Notman's catalytic gas reactor resulting in corresponding fourth, fifth, and sixth sub-chambers, and to optimize the dimension of Notman's orifice in each of the first and second patitions such that the largest orifice of each partition produce axis that are offset relative to each other, and to optimize the dimension (hight) of Notman's gas connector passageway such that his gas port disposed between the inlet and outlet of his passageway is to provide for longer residence time for the flowing gasses (column 3, lines 7-8; column 4, lines 12-17). Further, it is well established that the duplication of parts is obvious (In re Harza, 274 F.2d 669, 124 USPQ 378 (CCPA 1960) MPEP 2144.04). Further, OPTIMIZATION OF SIZES...

5. Claims 7 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mundt (USPat. 5,137,701) in view of Alan Notman (USPat. 4,311,671). Mundt teaches an etch apparatus (12, Figure 1; column 1, lines 22-34) which generates an etch gas product (down stream of item 12), where the etch gas apparatus being in fluid communication with an enclosure

Art Unit: 1763

(Figure 3) defining the process effluent abatement arrangement (18, 32, 16, 20, 36; Figure 1; column 5, lines 13-38).

Alan Notman is discussed above. However, Alan Notman does not teach an etch apparatus which generates an etch gas product, where the etch gas apparatus being in fluid communication with the gas connector such that the etch gas product generated by the etch apparatus is advanced into the interior void of the enclosure defining the process effluent abatement arrangement.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to replace Mundt's process effluent abatement arrangement with Alan Notman's catalytic gas reactor to process the effluent from Mundt's etch apparatus.

Motivation to replace Mundt's process effluent abatement arrangement with Alan Notman's catalytic gas reactor to process the effluent from Mundt's etch apparatus is to reduce the hazardous process chemicals from the etch reactor as taught by Mundt (column 1, lines 22-33).

6. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Alan Notman (USPat. 4,311,671) in view of Thomas G. McGinness. (USPat. 5,384,051). Alan Notman is discussed above. Alan Notman further teaches heating elements (60,62) as heat exchangers that are in thermal communication with the gas provided by the gas source at exchanger 62. As a result, Alan Notman does not teach an electrical heating element that is in thermal communication with the gas provided by the gas source. Thomas G. McGinness teaches an electrical heating element (32, Figure 1; column 8, lines 55-62) that is in thermal communication with the gas ("carrier fluid/oxidizer mixture") provided by the gas source.

Art Unit: 1763

It would have been obvious to one of ordinary skill in the art at the time the invention was made to replace Alan Notman's heating element with McGinness' electrical heating element.

Motivation to replace Alan Notman's heating element with McGinness' electrical heating element is to provide an alternate and equivalent means for heating.

7. Claims 12-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mundt (USPat. 5,137,701) in view of Alan Notman (USPat. 4,311,671) and Thomas G. McGinness. (USPat. 5,384,051). Alan Notman and Mundt are discussed above. Alan Notman further teaches heating elements (60,62) as heat exchangers that are in thermal communication with the gas provided by the gas source at exchanger 62. As a result, Alan Notman does not teach an electrical heating element that is in thermal communication with the gas provided by the gas source. Thomas G. McGinness teaches an electrical heating element (32, Figure 1; column 8, lines 55-62) that is in thermal communication with the gas ("carrier fluid/oxidizer mixture") provided by the gas source.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to add McGinness' heating element to be in thermal communication with the gas provided by the gas source of Alan Notman and Mundt, and to replace Mundt's process effluent abatement arrangement with Alan Notman's catalytic gas reactor to process the effluent from Mundt's etch apparatus.

Motivation to add McGinness' heating element to be in thermal communication with the gas provided by the gas source of Alan Notman is to control the temperature of the gas provided by the gas source of Alan Notman and Mundt.

Art Unit: 1763

Motivation to replace Mundt's process effluent abatement arrangement with Alan Notman's catalytic gas reactor to process the effluent from Mundt's etch apparatus is to reduce the hazardous process chemicals from the etch reactor as taught by Mundt (column 1, lines 22-33).

## Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Examiner Rudy Zervigon whose telephone number is (571) 272.1442. The examiner can normally be reached on a Monday through Thursday schedule from 8am through 7pm. The official after fax phone number for the 1763 art unit is (703) 872-9306. Any Inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Chemical and Materials Engineering art unit receptionist at (571) 272-1700. If the examiner can not be reached please contact the examiner's supervisor, Gregory L. Mills, at (571) 272-1439.
